INTRODUCTION

The Real Reason Growth Stalls

If you think you need to hire your way out of your current growth plateau, you're about to waste somewhere between $150,000 and $500,000.

Not because hiring is wrong. Because the hire won't fix what's broken.

You built something real. Your company has clients, revenue, a team that shows up every day, and a product or service that the market values. You've done what most entrepreneurs only dream of.

And yet, something doesn't add up.

Revenue is growing, but so is headcount. Every dollar of growth seems to require another hire. Your sales cycle takes longer than it should, and nobody can explain exactly why. Marketing generates leads that sales says aren't qualified. Client onboarding is inconsistent. Your CRM is a mess. You spend your Sunday evenings building spreadsheets because the reporting in your tools doesn't tell you what you need to know.

You've tried to fix this. Maybe you hired a marketing agency that delivered beautiful reports full of vanity metrics but couldn't connect activity to revenue. Maybe a CRM consultant configured your system 'by the book', but the team abandoned the process within weeks because it didn't match how they actually work. Maybe you've attended masterminds and coaching programs that gave you inspiration but zero operational implementation.

> "The gap between where you are and where you want to be isn't effort. It's systems."

Here's what nobody tells you: the companies you compete against, the ones growing faster with seemingly less effort, aren't smarter than you. They aren't working harder. They have something you don't: operational infrastructure. A revenue engine where marketing, sales,

and client success function as one connected system, not three separate departments pointing fingers at each other.

The good news? You don't need a $200,000 VP of Sales or a six-figure agency to build this. You need a methodology: a structured, proven framework that transforms how your existing team generates, converts, and retains revenue.

That's what this playbook delivers.

Over the next seven chapters, I'll walk you through the seven operational changes that allow companies like yours (those at $1M to $15M in revenue with 5 to 75 employees) to grow revenue 20-40% without proportionally growing headcount. Each chapter addresses one phase of the revenue engine. You'll learn what the problem looks like, why it matters, how to recognize it in your own company, and what the solution looks like at a high level.

> ***A note on what this playbook is and isn't:*** *This guide teaches you the what and why of each operational change. It is deliberately not a step-by-step implementation manual. Every company's situation is different, and the specific how depends on your team, your tools, your market, and your data. What's universal is the framework, and that's what you'll learn here.*

Who This Playbook Is For

You're a founder or CEO running a B2B or service business between $1M and $15M in annual revenue, with 5 to 75 employees. You're growing, but every new dollar of revenue feels like it requires another hire. You want to grow the business without scaling your payroll in lockstep, and you're ready to look at the systems underneath your revenue engine, not just the people sitting on top of them.

Who This Playbook Is Not For

If you're pre-revenue, doing less than $1M annually, or a solo operator with no team, the frameworks here will feel premature. If you're looking for a done-for-you service where an outside agency does the work on your behalf, this isn't the right fit either. And if you believe your growth problem is purely a marketing problem or purely a sales problem in isolation, the operational lens in this playbook will frustrate you before it serves you.

Let's begin.

> **Want a personalized read before you go deeper?**
>
> The Revenue Growth Scorecard takes 5 minutes and shows you which of the 7 phases is costing you the most right now.

THE FRAMEWORK

The 7-Phase Revenue Engine

The seven phases aren't seven separate projects. They're seven interconnected components of a single revenue engine. Each one reinforces the others. Break the cycle and the whole thing stalls. Fix the cycle and every dollar of marketing and sales effort compounds.

1 GTM Flywheel Audit
Find the friction

2 Sales-Marketing SLA
Align the teams

3 Inspectable Sales Process
Make it measurable

4 Tech Stack & Data Governance
Build the foundation

5 Client Lifecycle Playbook
Retain and expand

6 Resource Utilization & Capacity
Work smarter

7 Capital-Efficient Growth Scorecard

Prove it compounds

SELF-ASSESSMENT

Score Your Revenue Engine

Rate your company honestly. Circle or note your score (1 to 5) for each statement.

1 Not at all true **2** Mostly false **3** Partially true **4** Mostly true **5** Completely true

1.	**Ph.1**	We can clearly explain, with data, why our sales cycle takes as long as it does.	1 2 3 4 5
2.	**Ph.1**	Every inbound lead is contacted within 4 business hours.	1 2 3 4 5
3.	**Ph.2**	Sales and marketing share a single, written definition of a qualified lead.	1 2 3 4 5
4.	**Ph.2**	I can trace every closed deal back to the marketing activity that created it.	1 2 3 4 5
5.	**Ph.3**	Every stage of our sales process has objective, observable criteria, not seller opinions.	1 2 3 4 5
6.	**Ph.3**	Our sales forecast is accurate to within 15% three months out.	1 2 3 4 5
7.	**Ph.4**	Our team trusts the data in our CRM and doesn't maintain side spreadsheets.	1 2 3 4 5
8.	**Ph.4**	We have at least one AI copilot or automation saving measurable time each week.	1 2 3 4 5
9.	**Ph.5**	New clients follow a standardized onboarding playbook regardless of who manages them.	1 2 3 4 5
10.	**Ph.5**	We identify at-risk clients before they churn, not after.	1 2 3 4 5
11.	**Ph.6**	I can quantify how much productive capacity my team has available right now.	1 2 3 4 5
12.	**Ph.6**	Hiring decisions are based on utilization data, not on how overwhelmed the team feels.	1 2 3 4 5

13.	**Ph.7**	I know my CAC, LTV:CAC ratio, and revenue per employee without pulling a report.	1 2 3 4 5
14.	**Ph.7**	Our dashboards show leading indicators, not just last quarter's results.	1 2 3 4 5
15.	**Overall**	Over the last 12 months, revenue has grown faster than headcount.	1 2 3 4 5

YOUR SCORE

What Your Total Tells You

Add up your scores. The maximum is 75. Where you land points you to which phase of the playbook will have the biggest impact.

60 – 75 **Operating well**	You have mature revenue operations. Use the chapters to sharpen specific phases and identify AI leverage points. The Capital-Efficient Growth Scorecard (Chapter 7) is likely where the next wave of value sits.
45 – 59 **Moderate friction**	You have the basics in place but meaningful leakage across 2-3 phases. Focus on your lowest-scoring phase first. Most companies in this range unlock 15-25% revenue growth by fixing one or two phases without hiring.
30 – 44 **High friction**	Significant operational debt is throttling growth. Start with the GTM Flywheel Audit (Chapter 1) and the Sales-Marketing SLA (Chapter 2). These two phases alone typically recover 6-figure revenue leakage within 90 days.
15 – 29 **Severe friction**	Your revenue engine is leaking at nearly every phase. Coaching engagement recommended. The compounding cost of inaction at this level is usually greater than the cost of fixing the system.

Want a deeper read? The web version of the Revenue Growth Scorecard goes further: it analyzes your answers against industry benchmarks and suggests which 2-3 specific operational changes will move the needle fastest. Take it at modernbizops.com/scorecard.

1

PHASE ONE

The GTM Flywheel Audit

Find the friction before you add more fuel

The Operational Problem

Most growing companies don't have a revenue problem. They have a friction problem. Your go-to-market engine (the combined machine of marketing, sales, and client success) has invisible drag points that consume effort, waste budget, and slow growth. But because these friction points are spread across departments, nobody sees the full picture. Marketing blames sales for not closing. Sales blames marketing for bad leads. Client success is too busy firefighting to notice the patterns. The result: you throw more people, more budget, and more tools at a problem that isn't about volume. It's about friction.

Why It Matters

Every dollar of friction costs you far more than a dollar of revenue. A lead that takes 14 days to follow up instead of 14 minutes doesn't just reduce your conversion rate. It damages your brand, wastes the marketing spend that generated it, and demoralizes your sales team. Multiply that by dozens of friction points across your entire revenue engine, and you're looking at hundreds of thousands of dollars in leaked revenue annually. The companies that grow fastest aren't the ones spending the most. They're the ones with the least friction between a prospect's first touch and their long-term retention.

SIGNS YOU HAVE THIS PROBLEM

- You can't explain exactly why your sales cycle takes as long as it does
- Marketing and sales disagree about what constitutes a 'qualified lead'
- Customer churn feels random, and you can't predict who'll leave or why
- New hires take months to ramp because there's no documented process
- You're paying for 6+ software tools but aren't sure they're all connected

What the Solution Looks Like

A systematic, data-driven audit of your entire go-to-market engine that maps every handoff, every conversion point, and every drop-off across marketing, sales, and client success. This isn't a surface-level review. It's a friction map that shows you exactly where revenue leaks out of your system and quantifies the cost of each friction point. The audit connects to the tools your team already uses and analyzes actual performance data, not opinions or assumptions. The output is a prioritized list of the highest-impact friction points, ranked by revenue impact and implementation difficulty.

IN PRACTICE

Pipeline value +22% in 60 days. Zero new hires.

A $7M professional services firm believed they needed two more account executives to hit their growth targets. A GTM flywheel audit revealed that 34% of inbound leads were never contacted within the first 48 hours, and the handoff between marketing and sales had no defined criteria or SLA. By fixing the handoff alone, before touching anything else, their pipeline value increased 22% in 60 days with the same team.

2

PHASE TWO

The Sales-Marketing SLA

End the blame game with shared accountability

The Operational Problem

In most growing companies, marketing and sales operate as separate kingdoms with different goals, different metrics, and different definitions of success. Marketing celebrates lead volume. Sales complains about lead quality. Neither team has a shared, measurable agreement about what constitutes a qualified lead, how quickly it must be followed up, or what feedback loop should exist between the two. This misalignment doesn't just waste budget. It creates a culture of blame that erodes trust, slows decision-making, and makes it nearly impossible to diagnose what's actually working and what isn't.

Why It Matters

Without a Service Level Agreement between sales and marketing, you're essentially running two engines pointed in slightly different directions. Marketing optimizes for metrics that don't correlate with closed revenue. Sales cherry-picks leads based on gut feeling rather than data. The compounding cost is staggering: misallocated marketing spend, wasted sales capacity, longer sales cycles, and a leadership team that can't make confident growth decisions because the data from each department tells a different story. Companies with aligned sales and marketing functions generate 208% more revenue from their marketing efforts.

SIGNS YOU HAVE THIS PROBLEM

- Sales says most marketing leads are 'junk', and marketing disagrees
- You can't trace a closed deal back to the marketing activity that created it
- Lead follow-up times vary wildly and there's no standard for response speed
- Marketing and sales use different definitions for pipeline stages
- Revenue forecasting feels like guesswork because the funnel data is unreliable

What the Solution Looks Like

A formal, measurable agreement between your marketing and sales functions that defines lead qualification criteria, required response times, feedback mechanisms, and shared accountability metrics. This isn't a document that lives in a drawer. It's an operational contract with specific numbers, tracked weekly, and tied to both teams' performance. It includes shared definitions for every stage of the buyer journey, clear handoff protocols, and a structured feedback loop so marketing continuously improves lead quality based on actual sales outcomes.

IN PRACTICE

Marketing-sourced pipeline 2x in 90 days. Same ad spend.

A $4.5M SaaS company was spending $12K per month on paid advertising but couldn't prove ROI. Sales claimed only 1 in 10 marketing leads was worth pursuing. After implementing a sales-marketing SLA with shared lead scoring criteria and a mandatory 4-hour follow-up window, the team discovered that 40% of 'bad' leads had simply never been contacted. Within 90 days, marketing-sourced pipeline doubled, all with the same ad spend.

3

PHASE THREE

The Inspectable Sales Process

Replace gut instinct with a system you can see, measure, and improve

The Operational Problem

Your best salespeople close deals. Your average salespeople struggle. And nobody, including the top performers, can articulate exactly why. The sales process lives in people's heads, not in a documented, inspectable system. Pipeline reviews become storytelling sessions where reps narrate their deals rather than reporting against defined criteria. Forecasting is a combination of optimism and guesswork. When a salesperson leaves, their tribal knowledge walks out the door. When a new salesperson joins, they spend months figuring out 'how things work here' through trial and error.

Why It Matters

A sales process you can't inspect is a sales process you can't improve. If every deal follows a different path, you can't identify what's working, what's breaking, or where coaching would have the most impact. You're also unable to forecast reliably, which means you can't make confident hiring, inventory, or investment decisions. The cost isn't just in lost deals. It also shows up in the management time spent in pipeline review meetings that produce heat but no light, and in the opportunity cost of a team operating at 40-60% of its potential because there's no system to optimize.

SIGNS YOU HAVE THIS PROBLEM

- Pipeline reviews are narratives, not data; reps tell stories about deals instead of reporting stage-specific criteria
- Top performers close at 2-3x the rate of average performers, and nobody knows why
- Your sales forecast accuracy is below 70%
- New hires take 4+ months to close their first deal
- You can't tell a prospect's exact status without asking the assigned rep

What the Solution Looks Like

A documented, stage-gated sales process where every stage is defined by specific, observable buyer actions, not seller opinions. Each stage has entry criteria, required activities, and exit criteria that are objective and verifiable. This makes the process inspectable: a manager can look at any deal in the pipeline and assess its health based on data, not narrative. It also makes the process teachable, coachable, and continuously improvable. Combined with AI-powered analytics, the system identifies patterns in won and lost deals that human intuition alone would never catch.

IN PRACTICE

Sales cycle 47 to 26 days. Close rate 18% to 31%. Revenue +28%.

A $9M logistics company had a 47-day average sales cycle and an 18% close rate. Their sales process existed as a vague set of CRM stages that nobody followed consistently. After mapping and implementing an inspectable process with buyer-verified stage gates, their sales cycle dropped to 26 days and close rate increased to 31%. Revenue grew 28% the following quarter, all with the same number of salespeople.

4

PHASE FOUR

Tech Stack & Data Governance

Stop paying for tools nobody trusts and data nobody uses

The Operational Problem

The average growing company has 8-15 software tools in its revenue stack: CRM, marketing automation, email, analytics, project management, support tickets, and more. But in most cases, these tools are poorly configured, loosely integrated, and inconsistently used. The CRM is half-empty because salespeople see it as an administrative burden rather than a selling tool. Marketing automation runs on autopilot with no connection to actual revenue outcomes. Data lives in silos: marketing data in one system, sales data in another, client data in a third. The result is a tech stack that costs you money every month while delivering unreliable data that nobody trusts enough to make decisions with. And now there's a new twist: companies are bolting AI tools on top of this broken foundation, hoping the technology will fix the underlying mess. It won't. AI built on dirty, siloed data simply automates bad decisions at scale.

Why It Matters

Bad data is worse than no data, because it creates false confidence. You make hiring decisions, pricing decisions, and investment decisions based on numbers that are incomplete or inaccurate. Every manual workaround your team builds to compensate for broken integrations is a hidden labor cost. Every hour a salesperson spends updating a CRM they don't trust is an hour not spent selling. And every meeting where you argue about whose numbers are right (marketing's dashboard vs. sales' spreadsheet vs. finance's report) is a meeting wasted. The companies that win aren't the ones with the most tools. They're the ones whose tools actually work together and produce a single source of truth.

In 2026, that single source of truth is also what unlocks AI as a genuine force multiplier. AI copilots, predictive models, and intelligent automation all compound the value of clean, well-governed data. On a fragmented stack they deliver noise. On a unified stack they deliver revenue.

SIGNS YOU HAVE THIS PROBLEM

- Your team maintains spreadsheets alongside the CRM because they don't trust the CRM data
- Marketing reports different pipeline numbers than sales does
- You're paying for tools that fewer than half the team actively uses
- Integrations between systems are broken or require manual data transfer
- It takes an hour to pull a report that should take five minutes

What the Solution Looks Like

A comprehensive audit of your technology stack and data architecture that identifies what's working, what's redundant, and what's missing. The audit is followed by a governance framework that ensures data quality, consistent tool usage, and reliable reporting. This includes rationalization of your tech stack (you're probably paying for tools you don't need), proper configuration and integration of the tools you keep, defined data entry standards, and an organizational blueprint for who owns revenue operations as the company grows. Layered on top is an AI enablement strategy that turns the cleaned-up stack into an intelligent system. That means AI-powered data hygiene that automatically enriches contacts, deduplicates records, and validates information so your CRM stays clean without manual effort. It means AI copilots that capture call notes, log activities, and update opportunity stages from emails and meetings so reps spend their time selling instead of typing. It means predictive scoring that surfaces the leads most likely to close and the clients most likely to churn, built on your own historical data rather than generic benchmarks. It means natural-language reporting, where anyone in the business can ask a question in plain English and get an accurate answer in seconds, without waiting on an analyst. And it means intelligent workflow orchestration that routes leads, assigns tasks, and triggers escalations automatically based on real-time signals across the stack. The

goal isn't more technology. It's technology that actually serves your team, produces data you can trust, and makes every person measurably more productive than they were the week before.

IN PRACTICE

$1,800/mo saved. Reporting from 12 hours to 45 minutes. 6 hours per rep per week back.

A $5.5M recruitment firm was paying $4,200 per month across 11 software tools. An audit revealed that 3 tools had overlapping functionality, 2 were virtually unused, and the CRM had a 44% data completion rate. After consolidating to 7 tools, implementing data governance standards, deploying an AI copilot that auto-logged sales activities and enriched contact records, and properly integrating the remaining stack, they saved $1,800 per month in software costs, lifted CRM data completeness above 90% within a single quarter, and reduced their monthly reporting time from 12 hours to 45 minutes. Their sales team recovered roughly 6 hours per person per week, which was redirected straight into client conversations.

If any of that hit close to home...

Book a free 45-minute Discovery Call. No pitch. We'll map your 2-3 biggest friction points live and tell you whether working together makes sense.

5

PHASE FIVE

The Client Lifecycle Playbook

Turn one-time buyers into long-term revenue engines

The Operational Problem

Most growing companies are obsessed with acquisition and neglect everything that happens after the sale. Client onboarding is inconsistent: some clients have a wonderful experience, while others fall through the cracks. There's no systematic approach to driving adoption, measuring satisfaction, identifying expansion opportunities, or preventing churn. Client success is reactive: the team responds to problems instead of preventing them. The irony is brutal. You spend thousands of dollars acquiring a client, then lose them because the post-sale experience is disorganized, unpredictable, and dependent on whichever team member happens to be assigned.

Why It Matters

Acquiring a new client costs 5-7x more than retaining an existing one. A 5% improvement in client retention can increase profits by 25-95%. Yet most companies invest 80% of their growth budget in acquisition and 20% in retention. The math is backwards. Every churned client represents not just lost revenue, but lost referral potential, lost expansion revenue, and wasted acquisition cost. Worse, inconsistent client experiences create negative word-of-mouth that actively works against your acquisition efforts. The fastest path to revenue growth isn't always more leads. It's often keeping and growing the clients you already have.

SIGNS YOU HAVE THIS PROBLEM

- Client onboarding varies significantly depending on who manages the account
- You don't know your churn rate, or you know it and it's above 15% annually
- Expansion revenue (upsells, cross-sells) happens by accident, not by design
- Client health is measured by 'they haven't complained lately'
- Departing account managers take client relationships with them

What the Solution Looks Like

A structured client lifecycle playbook that standardizes every phase of the post-sale experience: onboarding, adoption, value realization, expansion, and renewal. Each phase has defined milestones, communication templates, health scoring criteria, and escalation protocols. The playbook transforms client success from a reactive firefighting function into a proactive revenue driver. Combined with AI-powered health scoring and automated check-in triggers, the system identifies at-risk clients before they churn and surfaces expansion opportunities based on usage patterns and engagement signals.

IN PRACTICE

Churn 22% to 11%. Expansion revenue +35% from existing clients.

An $8M managed IT services company had a 22% annual client churn rate and no formal onboarding process. After implementing a structured lifecycle playbook with defined onboarding milestones, quarterly business reviews, and automated health scoring, their churn dropped to 11% within two quarters. More importantly, expansion revenue from existing clients increased 35% because the structured touchpoints surfaced upgrade opportunities that had previously gone unnoticed.

6

PHASE SIX

Resource Utilization & Capacity

Know exactly what your team can handle, and what they can't

The Operational Problem

Growing companies hire reactively. Revenue increases, the team feels overwhelmed, and the response is to add headcount. But nobody can quantify whether the existing team is actually at capacity, or whether broken processes, wasted effort, and misallocated resources are creating the illusion of being understaffed. Without a utilization and capacity framework, you can't distinguish between 'we need more people' and 'we need our current people doing different things.' The result is bloated headcount, eroding margins, and a founder who feels like growth is a treadmill, where every dollar of new revenue requires a proportional dollar of new labor cost.

Why It Matters

Headcount is the single largest expense in most service and B2B companies, typically consuming 50-70% of revenue. Adding a single employee costs far more than their salary. Onboarding, training, management overhead, tools, benefits, and cultural integration all add up. If you're adding headcount to compensate for process inefficiency, you're not just wasting money. You're adding complexity that makes the underlying problems harder to fix. The companies that achieve 'capital-efficient growth' (those growing revenue faster than they grow headcount) are the ones that obsessively measure utilization, eliminate waste, and only hire when the data proves it's necessary.

SIGNS YOU HAVE THIS PROBLEM

- Your headcount has grown at the same rate (or faster) than your revenue for two years running
- Team members spend more than 25% of their time on administrative tasks
- You can't quantify how much productive capacity your team has available
- Hiring decisions are based on 'the team is overwhelmed' rather than utilization data
- Gross margins have declined as revenue has grown

What the Solution Looks Like

A resource utilization and capacity dashboard that gives you real-time visibility into how your team's time is being spent, what's productive versus wasteful, and where you have genuine capacity constraints versus process-created bottlenecks. This framework includes activity categorization (revenue-generating, revenue-supporting, administrative, waste), time allocation benchmarks by role, capacity modeling for growth scenarios, and AI-powered identification of tasks that can be automated. The goal is to answer one question definitively: 'If we fix the process, do we still need to hire?'

IN PRACTICE

1.5 FTEs of capacity recovered. $180K saved annually. Two avoided hires.

A $6M digital agency was about to hire three additional project managers because the existing team was 'at capacity.' A utilization analysis revealed that project managers were spending 38% of their time on status reporting, manual time tracking, and internal meetings, none of which delivered client value. By automating status reporting and restructuring meeting cadences, the team recovered the equivalent of 1.5 full-time employees worth of productive capacity, eliminating the need for two of the three planned hires and saving $180K annually.

7

PHASE SEVEN

The Capital-Efficient Growth Scorecard

Measure what matters, and prove your business is getting more valuable

The Operational Problem

Most founders track revenue and maybe a few activity metrics. But the numbers that actually determine whether your business is becoming more valuable (or less) are often unmeasured, misunderstood, or buried in disconnected spreadsheets. You might know your revenue is growing, but can you confidently state your customer acquisition cost, your LTV:CAC ratio, your gross margin per client, or your revenue per employee? Without these unit economics, you're flying blind. You can't tell whether growth is healthy or whether you're buying revenue at a loss. You can't demonstrate to an investor, lender, or acquirer that your business is a scalable, efficient machine.

Why It Matters

The difference between a company valued at 3x revenue and one valued at 8x revenue is almost never the revenue itself. It's the operational metrics beneath it. Predictable revenue, efficient acquisition, strong retention, and high revenue per employee signal a business that scales without proportionally scaling cost. These metrics aren't just for companies planning to sell. They're the same metrics that tell you whether your growth strategy is working, where to invest next, and when to change course. Without a scorecard, you're reacting to lagging indicators (last quarter's revenue) instead of leading indicators (this month's pipeline efficiency, conversion trends, and capacity utilization).

SIGNS YOU HAVE THIS PROBLEM

- You know your revenue but can't confidently state your customer acquisition cost
- Your reporting is backward-looking, showing last quarter's results rather than this month's trajectory
- You've never calculated your LTV:CAC ratio or revenue per employee
- Financial reviews focus on P&L; line items rather than operational efficiency metrics
- If asked to prepare for a valuation or investor meeting, it would take weeks to assemble the data

What the Solution Looks Like

A comprehensive growth scorecard that tracks the metrics which actually determine business value: CAC and CAC payback period, LTV:CAC ratio, gross margin per client, revenue per employee, net revenue retention, pipeline velocity, and operational efficiency ratios. This isn't a static report. It's a living dashboard that updates automatically from your existing tools and provides trend analysis, benchmarks against industry standards, and early warning indicators when metrics move in the wrong direction. The scorecard transforms how you make decisions: instead of reacting to revenue numbers, you proactively manage the operational levers that drive them.

IN PRACTICE

Margins +8 points. Nearly $1M added to annual profit. Zero new clients required.

A $12M B2B services company had never tracked unit economics beyond revenue and gross margin. After implementing a growth scorecard, they discovered that their fastest-growing client segment actually had a negative LTV:CAC ratio due to high acquisition costs and above-average churn. By reallocating marketing spend to their most profitable segments and implementing targeted retention strategies, they improved overall margins by 8 percentage points within two quarters, adding nearly $1M to annual profit without acquiring a single new client.

CONCLUSION

Building Your Revenue Engine

If you've read this far, you've just seen your business through a new lens. The seven phases aren't seven separate projects. They're seven interconnected components of a single revenue engine. The GTM audit reveals the friction. The sales-marketing SLA aligns the teams. The inspectable sales process creates predictability. The tech stack and data governance provide the foundation. The client lifecycle playbook protects and grows existing revenue. The capacity framework ensures efficiency. And the growth scorecard measures it all.

Together, they transform a company from one that grows by adding people to one that grows by adding **capability**.

> "Growth shouldn't require proportional headcount growth.
> The operating system for capital-efficient growth already exists.
> You just need to install it."

The companies that compete at the highest level in your market aren't doing it with twice the headcount and ten times the budget. They're doing it with systems: the same systems outlined in this playbook. The difference between knowing what those systems are and actually implementing them in your specific business is where most companies get stuck.

That's where the work begins.

Your Next Steps

1. Take the Revenue Growth Scorecard. A free diagnostic that scores your company across these seven dimensions and shows you exactly where your biggest friction points are. It takes 5 minutes and gives you a personalized assessment of where to focus first.

2. Book a Discovery Call. A free, 45-minute conversation where we discuss your specific situation, identify your two or three highest-impact opportunities, and determine whether working together makes sense. This isn't a sales pitch. It's an honest conversation. If it's a fit, I'll show you exactly how we'd work together. If it's not, I'll tell you that too.

RESOURCES

Books, Tools & Frameworks

A curated set of resources I return to often, organized by where they'll help.

Start Here: Modern BizOps

Revenue Growth Scorecard
A free 5-minute self-assessment that scores your company across the 7 phases of this playbook.

The Watch Page
A 15-minute video explaining how the Modern BizOps coaching engagement works, who it's for, and what results to expect.

Books

The Revenue Architecture (Jacco van der Kooij)
The modern playbook for how marketing, sales, and customer success actually work as one system.

Obviously Awesome (April Dunford)
The clearest book on positioning for B2B companies. Every growing founder should read it twice.

The Great CEO Within (Matt Mochary)
The operational manual for founder-CEOs who are building beyond themselves. Pragmatic, tactical, honest.

$100M Leads (Alex Hormozi)
Blunt, high-signal framework for how to generate leads without spending more on acquisition.

Podcasts & Newsletters

The Revenue Formula
Deep operational breakdowns of how high-growth B2B companies build their revenue engines.

Lenny's Newsletter
The benchmark for B2B product and growth thinking. Read weekly.

The Diary of a CEO
Founder-to-founder conversations that get deeper than the usual podcast circuit.

Frameworks to Borrow

MEDDICC / MEDDPICC

The most widely adopted B2B sales qualification framework. Used in the Inspectable Sales Process phase of this playbook.

Jobs to be Done

Clayton Christensen's framework for understanding why customers buy. Sharpens positioning and onboarding.

North Star Metric

A single metric that aligns the entire company around one outcome. A useful lens in the Growth Scorecard phase.

ABOUT THE AUTHOR

Bradley de Wet

Founder, Modern BizOps

WHY I WROTE THIS

Over 15 years of building revenue operations inside VC-backed startups, I watched the same pattern repeat. A founder with a real business, a good product, and a talented team would hit a ceiling. Growth would slow. The instinct was always the same: hire more people. It almost never worked. What worked was fixing the system underneath: the way marketing, sales, and client success fit together as one machine. I wrote this playbook because the frameworks that unlocked growth inside $50M and $100M companies are not secret, not complicated, and not reserved for the well-funded. They just aren't being taught to the founder-operators who need them most. My goal is simple: give you the same operational lens the best-run companies use, so you can build something that compounds without burning you out.

Bradley de Wet has spent over 15 years building revenue operations inside high-growth, VC-backed startups. He hasn't just advised on these systems. He's been the person in the seat, building and executing them.

Across 15+ startup engagements, Bradley has personally cut sales cycles in half, doubled conversion rates, and saved over a million dollars in annual recurring revenue from churn. He's built the go-to-market machines that turned early-stage companies into scalable businesses, and he's seen firsthand what works, what doesn't, and why most off-the-shelf solutions fail for growing companies.

In 2025, Bradley founded Modern BizOps to bring enterprise-grade revenue operations to the companies that need it most: founder-led businesses between $1M and $15M in revenue that are growing but hitting operational ceilings. His done-with-you coaching model, powered by a proprietary diagnostic app and AI-driven automation, delivers the same operational frameworks that big-budget companies use, without the big-budget headcount.

Bradley's approach is different because his experience is different. He doesn't teach theory from the sidelines. He builds systems from the inside, and then coaches founders and their leadership teams to own and operate those systems permanently.
